

OPEN DATA SUPPORT

Training Module 2.4

Designing and developing RDF vocabularies

PwC firms help organisations and individuals create the value they're looking for. We're a network of firms in 158 countries with close to 180,000 people who are committed to delivering quality in assurance, tax and advisory services. Tell us what matters to you and find out more by visiting us at www.pwc.com. PwC refers to the PwC network and/or one or more of its member firms, each of which is a separate legal entity. Please see www.pwc.com/structure for further details.

Presentation metadata

Open Data Support is funded by the European Commission under SMART 2012/0107 'Lot 2: Provision of services for the Publication, Access and Reuse of Open Public Data across the European Union, through existing open data portals'(Contract No. 30-CE-0530965/00-17).

© 2014 European Commission

This presentation has been created by PwC

Authors:

Nikolaos Loutas, Michiel De Keyzer and Stijn Goedertier

Learning objectives

By the end of this training module you should have an understanding of:

- What the best practices are for creating an RDF vocabulary for modelling your data
- Where to find RDF vocabularies for reuse.
- How you can create your own RDF vocabulary.
- How to publish your RDF vocabulary.
- The process and methodology for developing semantic agreements developed by the ISA Programme of the European Commission.

Content

This module is about...

- The steps for modelling your data.
- How to reuse existing vocabularies to model your data.
- How to create new classes and properties in RDF.
- How and where to publish your RDF vocabulary so that it can be reused by others.

RDF Vocabulary

“A vocabulary is a data model comprising classes, properties and relationships which can be used for describing your data and metadata.”

- RDF Vocabularies are ***sets of terms*** used to describe things.
- A term is either a ***class or a property***.
 - Object type properties (relationships)
 - Data type properties (attributes)

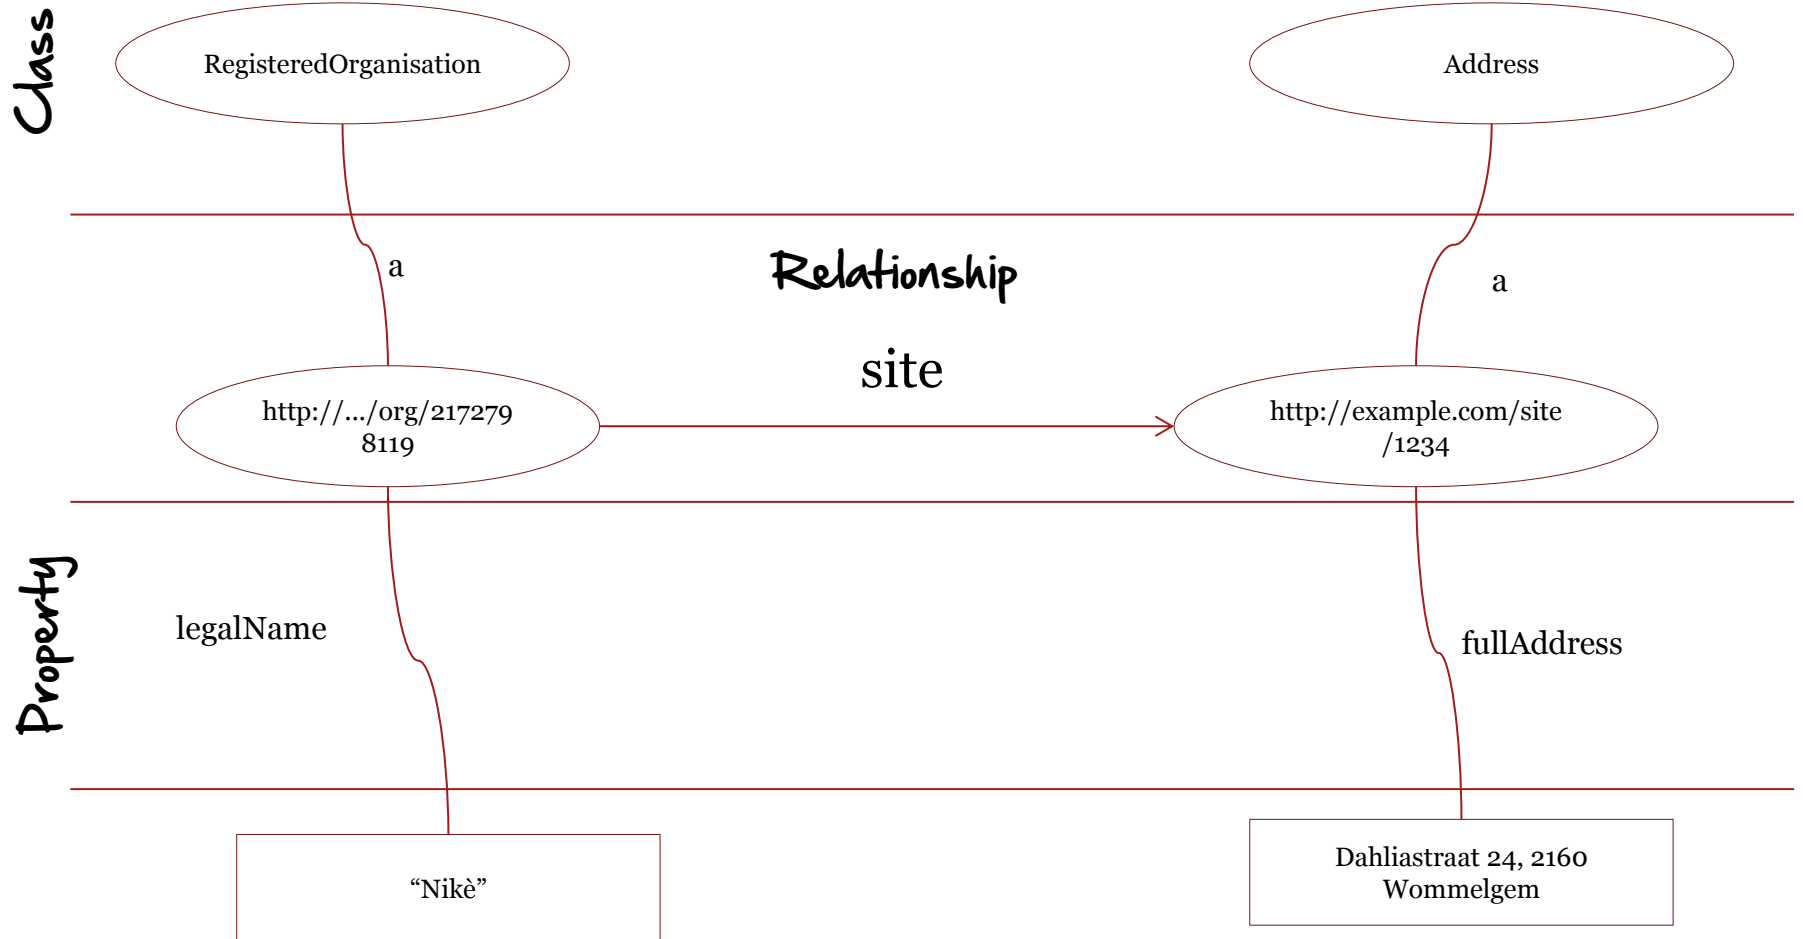

What are classes, relationships and properties?

Class. *A construct that represents things in the real and/or information world*, e.g. a person, an organisation, a concepts such as “health” or “freedom”.

Relationship. *A link between two classes*; for the link between a document and the organisation that published it (i.e. organisation *publishes* document), or the link between a map and the geographic region it depicts (i.e. map *depicts* geographic region). In RDF relationships are encoded as object type properties.

Property. *A characteristic of a class* in a particular dimension such as the legal name of an organisation or the date and time that an observation was made.

Examples of classes, relationships and properties

Model your data

How to reuse from other vocabularies, define your own terms and publish and promote your vocabularies to describe the data.

6 steps for modelling your data

- 1** Start with a **robust Domain Model** developed following a structured process and methodology.
- 2** Research **existing terms** and their usage and **maximise reuse** of those terms.
- 3** Where new terms can be seen as specialisations of existing terms, create **sub class** and **sub properties**.
- 4** Where **new terms** are required, create them following **commonly agreed best practice**.
- 5** Publish within a **highly stable environment** designed to be **persistent**.
- 6** **Publicise the RDF schema** by registering it with relevant services.

location

2 Reuse existing terms and vocabularies

- General purpose vocabularies: DCMI, RDFS

- To name things: rdfs:label, foaf:name, skos:prefLabel

- To describe people: FOAF, vCard, Core Person Vocabulary

- To describe projects: DOAP, ADMS.SW

- To describe interoperability assets: ADMS

- To describe registered organisations: Registered Organisation Vocabulary

- To describe addresses: vCard, Core Location Vocabulary

- To describe public services: Core Public Service Vocabulary

- To describe datasets: DCAT, DCAT Application Profile, VoID

Creating application profiles

- **Different domains** have **different requirements** for domain-specific semantics, e.g. classification concepts.
- Generic RDF vocabularies usually provides the **core base classes** needed to allow extensions to add specific sub-class structures or classification schemes as required.
- In such cases, reusers are encouraged to define **application profiles particular to an application domain** by specifying (if required) **sub-classes, sub-properties** and **controlled vocabularies**.
- For example,
 - [DCAT Application profile for data portals in Europe](#)
 - [Registered Organization vocabulary](#) as an application profile of the [Organization ontology](#).

See also:

joinup.ec.europa.eu/asset/dcat_application_profile/home

Advantages of reuse

- Reuse greatly **aids interoperability** of your data
 - Use of `dcterms:created`, for example, the value for which should be a data typed date such as `2013-02-21^^xsd:date`, is immediately processable by many machines. If your schema encourages data publishers to use a different term and date format, such as `ex:date "21 February 2013"` – data published using your schema will require further processing to make it the same as everyone else's.
- Reuse **adds credibility** to your schema.
 - It shows it has been published with care and professionalism, again, this promotes its reuse.
- Reuse is **easier and cheaper**.
 - Reusing classes and properties from well defined and properly hosted vocabularies avoids your having to replicate that effort.

You can find reusable RDF vocabularies on...

The screenshot shows the Joinup website interface. At the top, there is a navigation bar with the Joinup logo and the European Commission logo. Below the navigation bar, there is a search bar and a "Search" button. The main content area displays search results for "organisation RDF". The results are sorted by date and show two items: "Organisation Type List" and "Enterprise Competence Organisation Schema".

<http://joinup.ec.europa.eu/>

<http://lov.okfn.org/>

The screenshot shows the Linked Open Vocabularies (LOV) website interface. At the top, there is a navigation bar with the LOV logo and the logos of MONDECA, Inserm, and ANADFT. Below the navigation bar, there is a search bar and a "Search" button. The main content area displays search results for "organisation". The results are filtered by domain and type. The results list includes various vocabularies such as "swrc:Organization", "foaf:Organization", "org:organization", "org:Organization", "cgov:postIn", "meb:organisation", and "loted:RP".

3 *Creation of sub-classes and sub-properties*

- RDF schemas and vocabularies often include **terms that are very generic**.
- By creating **sub-class** and **sub-property** relationships, systems that understand the super property or super class may be able to interpret the data even if the more specific terms are unknown.
- **Do not create sub-classes and sub-properties simply to allow you to use your own term** for something that already exists.

Creation of sub-properties - example

The Registered Organization vocabulary defines three sub-properties of `org:classification`: `companyType`, `companyStatus` and `companyActivity`.

Company Type

Property	Domain	Range
<code>rov:companyType</code> <code>rdfs:subPropertyOf org:classification</code>	<code>org:Organization</code>	<code>skos:Concept</code>

This property records the type of company. Familiar types are SA, PLC, LLC, GmbH etc. At the time of publication, there is no agreed set of company types that crosses borders. The term 'SA' is used in Poland although they mean slightly different things. The UK's LLP and Greece's EPE provide further example of close, but not exact, matches.

That said, each jurisdiction will have a limited set of recognized company types and these should be expressed in a consistent manner in a SKOS Concept Scheme.

Company Status

Property	Domain	Range
<code>rov:companyStatus</code> <code>rdfs:subPropertyOf org:classification</code>	<code>org:Organization</code>	<code>skos:Concept</code>

Recording the status of a company presents the same issues as its type. The terms 'insolvent', 'bankrupt' and 'in receivership,' for example, are likely to mean slightly different things with different legal implications.

Taking advice from [XBRL Europe](#) as a starting point, however, the term 'Normal Activity' does appear to have cross-border usefulness and this should be used in preference to terms like 'trading' or 'operating.'

Best Practice for recording various other status levels is to use the relevant jurisdiction's terms and to encode these in a SKOS Concept Scheme.

Company Activity

Property	Domain	Range
<code>rov:companyActivity</code> <code>rdfs:subPropertyOf org:classification</code>	<code>org:Organization</code>	<code>skos:Concept</code>

Defining a sub-property in RDF

```
<rdf:Property rdf:about="rov:companyType">
```

```
  <rdfs:label xml:lang="en">company type</rdfs:label>
```

```
  <rdfs:comment xml:lang="en" rdf:parseType="Literal">
```

This property records the type of company. Familiar types are SA, PLC, LLC, GmbH etc. Each jurisdiction will have a limited set of recognised company types and these should be used in a consistent manner using a `skos:Concept` as described in the [Code](#skos:Concept) Class.

```
</rdfs:comment>
```

```
  <rdfs:isDefinedBy rdf:resource="http://www.w3.org/ns/regorg#" />
```

```
  <rdfs:range rdf:resource="skos:Concept" />
```

```
  <rdfs:subPropertyOf rdf:resource="org:classification" />
```

```
  <dcterms:identifier>legal:companyType</dcterms:identifier>
```

```
</rdf:Property>
```

4 *Where new terms are required, create them following commonly agreed best practices*

- ✓ Classes begin with a capital letter and are always singular, e.g. skos:Concept.
- ✓ Properties begin with a lower case letter, e.g. rdfs:label.
- ✓ Object properties should be verbs, e.g. org:hasSite.
- ✓ Data type properties should be nouns, e.g. dcterms:description.
- ✓ Use camel case if a term has more than one word, e.g. foaf:isPrimaryTopicOf.

Defining a new class - Organisation

```
<rdf:RDF
```

```
  xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"
  xmlns:org="http://example.org/organisation-schema">
```

```
<rdf:Class rdf:about="org:Organisation">
```

```
  <rdfs:label xml:lang="en">Organisation</rdfs:label>
```

```
  <rdfs:comment xml:lang="en">
```

Legal entity that is registered in an official national or regional register.

```
  </rdfs:comment>
```

```
</rdf:Class>
```

Defining a new property - registrationNumber

```
<rdf:RDF
```

```
  xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"
  xmlns:org="http://example.org/organisation-schema">
```

```
<rdf:Property rdf:about="org:registrationNumber">
```

```
  <rdfs:label xml:lang="en">registrationNumber</rdfs:label>
```

```
  <rdfs:comment xml:lang="en">
```

in the The number that a registered organisation receives upon registration
official register.

```
  </rdfs:comment>
```

```
</rdf:Class>
```

Defining domain and range restrictions

```
<rdf:RDF
```

```
  xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"
```

```
  xmlns:org="http://example.org/organisation-schema"
```

```
  xmlns:locn="http://www.w3.org/ns/locn#">
```

```
<rdf:Property rdf:about="org:isLocated">
```

```
  <rdfs:label xml:lang="en">isLocated</rdfs:label>
```

```
  <rdfs:comment xml:lang="en">
```

The official address of the registered organisation's headquarters.

```
</rdfs:comment>
```

```
  <rdfs:domain rdf:resource="org:Organisation"/>
```

```
  <rdfs:range rdf:resource="locn:Address">
```

```
</rdf:Class>
```

```
http://example.org/org/1234 org:isLocated http://dbpedia.org/page/Brussels
```

5 *Publish within a highly stable environment designed to be persistent*

- Choose a stable namespace for your RDF schema (e.g. W3C, Purl...)
- Use good practices on the publication of persistent Uniform Resource Identifiers (URI) sets, both in terms of format and of their design rules and management.
- Examples:
 - <http://www.w3.org/ns/adms>
 - <http://purl.org/dc/elements/1.1>

<https://joinup.ec.europa.eu/community/semic/document/cookbook-translating-data-models-rdf-schemas>

<http://www.slideshare.net/OpenDataSupport/design-and-manage-persitent-uris>

6 Publicise the RDF schema by registering it with relevant services

Once your RDF schema is published you will want people to know about it. To reach a wider audience register it Joinup and Linked Open Vocabularies.

The image shows two screenshots of web interfaces. The left screenshot is from Joinup, displaying an advanced search for 'organisation'. It features a sidebar with filtering options and a main search area with results. Annotations include a green circle '1' over the search bar, a blue circle '2' over the filters, and an orange circle '3' over a result. The right screenshot is from Linked Open Vocabularies (LOV), showing search results for 'organisation' with a list of URIs and scores. Handwritten annotations include 'More focused.' in green, 'More targeted.' in blue, and 'More relevant.' in orange.

More focused.

More targeted.

More relevant.

Refine the search results via the faceted search filters.

Conclusions

Analyse

Start with a robust Domain Model developed following a structured process and methodology.

Research existing terms and their usage and maximise reuse of those terms.

Model

Where new terms can be seen as specialisations of existing terms, create sub class and sub properties as appropriate.

Where new terms are required, create them following commonly agreed best practice in terms of naming conventions etc

Publish

Publish within a highly stable environment designed to be persistent.

Publicise the RDF schema by registering it with relevant services.

Group exercise

<http://www.visualpharm.com>

In groups of 2, create the RDF description of a vocabulary for representing a citizen.

<http://www.visualpharm.com>

According to you, what are the main barriers to the reuse of existing RDF vocabularies?

Take also the online test [here!](#)

Thank you!
...and now YOUR questions?
