**Presentation @ ICEGOV**  
April 2020 in Greece

# Agenda: morning

- 9:00 ● **Welcome & coffee**
- 9:30 ● **Introduction and workshop dynamic**  
by Miguel Alvarez-Rodriguez and Michiel De Keyzer
- 9:45 ● **What are we going to discuss today?**
  - Catalogue of Services: overview of the action and its latest activities
  - Today's agenda
- 10:00 ● **Single Digital Gateway Model: Business perspective**
- 10:30 ● **Break**
- 10:50 ● **SDG Data Model - Part 1**
  - Practical exercise using the model
  - Discussion on the issues raised
- 12:05 ● **SDG Data Model**  
Plenary Reflections on the discussions
- 12:20 ● **Lunch**

# Agenda: afternoon

- 13:35 ● **SDG Data Model – Part 2**
- Discussion on the issues
  - Classifications (Tentative)
- 14:20 ● **SDG Data Model**
- Plenary Reflections on the SDG Data Model and identified next steps
- 14:45 ● **Break**
- 15:05 ● **Demo**
- As a public administration, how can I create a catalogue of services?
- 15:20 ● **Parallel Sessions:**
- Tools for catalogues of services and how they would work in the SDGR context
  - What would you see next for the Catalogues of Services action in the context SDG implementation?
- 16:00 ● **Outcomes of the parallel sessions**
- 16:15 ● **Wrap-up and closing**

Single Digital  
Gateway Model:  
Business Perspective

# Benefits of the Single Digital Gateway

1. **Search** and **find** information in a user-centric way
2. Access the content on a **single point of access**
3. Collect **statistics** for back office
4. Collect the **feedback** from the end-users
5. **Digitalising** procedures, reduce paperwork
6. Use the **Once-Only Principle**: users should not have to submit to public administration data already held by another public administration

# Those benefits are directly based on the regulation

## Objectives

## From the regulation

## Challenges

**Findability** of information on the single market in user-centric approach

Article 2.2: The gateway shall give access to information on online and offline procedures and links to online procedures, including procedures covered by Annex II

Information quality and structure, exchange, maintenance

Article 10: [users] have access to a sufficiently comprehensive, clear and user-friendly explanation of the following elements [...]  
Article 18: Common user interface  
Article 21.1: Search engine for the SDG

Data quality, data structure, user friendliness

Transforming all procedures to be **online available** cross-border

Article 6: Each Member State shall ensure that users can access and complete any of the procedures listed in Annex II fully online, provided that the relevant procedure has been established in the Member State concerned.  
Article 13.2 users are able to access the instructions for completing the procedure in an official language of the Union

Naming conventions, granularity, translation, OOP, common representation of the instructions, integration of the different service requirements for digital procedures (eID, eSignature, evidence, payments etc.)

Human intervention in **updating links** of public services

Paragraph 55: To minimise human intervention in the updating of the links to be used by the common user interface, a direct connection between the relevant technical systems of the Member States and the repository for links should, where technically possible, be established.

Data exchange, machine-readability

...

...

...

# What is the timeline?

## Entry into force (article 39)

### December 2020

*Information* on rights, obligations, rules, procedures, assistance and problem-solving services

*Information* in Annexes I, II and III

### December 2022

Delay for municipalities

### December 2023

Fully online *procedures* (Art. 6, 13)

Once-only principle (Art. 14, 15)

# What is required from us concerning the closest deadline?

## December 2020

*Information* on rights, obligations, rules, procedures, assistance and problem-solving services

*Information* in Annexes I, II and III

Art. 19  
**establish** and **maintain** an electronic repository for links to the information, procedures and assistance and problem-solving services, allowing the connection between such services and the common user interface.

Art. 19  
[Information] **accessible** on the **webpages** managed by competent authorities, or by private or semi-private entities as referred to in Article 7(3)

Art. 9 and 10  
Quality of information on **rights, obligations and rules**  
Quality of information on **procedures**

# What about the latest deadline?

## December 2023

Fully online *procedures* (Art. 6, 13)

Once-only principle (Art. 14, 15)

Provide fully  
online  
procedures  
according to  
OOP

Art. 6  
Procedures to be offered  
**fully online**

Art. 13  
**Cross-border access** to  
online procedures

Art. 14  
Technical system for the  
cross-border **automated  
exchange of evidence** and  
application of the  
**'once-only' principle**

Art. 15  
**Verification of evidence**  
between Member States

# Overview & prioritisation of the use cases

## **Use Case 1**

Feeding the Repository of Links using your own data model

## **Use Case 2**

Using the SDG Data Model for feeding National/EU Portals

## **Use Case 3**

Exchanging information

**Why** do we need a common data model for implementing the SDGR?

Citizen

Business

Administration

## QUICK SEARCH

Country

Netherlands 

Level

- Local
- National
- International

Search

## SEARCH BY LIFE EVENT

Birth

Residence

Studying

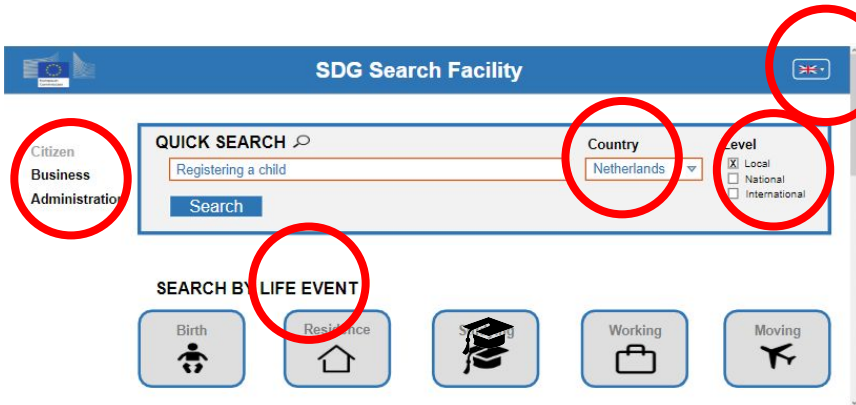

Working

Moving

If we want to give users a positive experience, there is a need to **structure** the information.

### Service

Title	Country	Geographic level	Event	Competent authority	Language
Registering a child	The Netherlands	Local	Having a child	Municipality of Utrecht	English, Dutch

### Event

Name	Description	Output
Having a child	This life event groups public services related to becoming a caretaker for a child, for instance in case of giving birth, adopting, receiving a foster child...	Proof of registration of birth or birth certificate

### Public organisation

Official name	Preferred label	Geographic coverage	Contact
Municipality of Utrecht	Expat Center Utrecht	Local	Expat Center Utrecht, Stadsplateau 1, 3521 AZ Utrecht Tel. 030 286 00 00

This would enable users to **search** and **find information** easily.

But what if each public administration in Europe has a **different way** of structuring, naming and describing the same information?

**Service** **Public administration 1** 

Title	Country	Geographic level	Owner	Language
Providing proof of registration of birth	Spain	Local	Municipality of Madrid	English, Spanish

**Procedure** **Public administration 2** 

Name	Country	Spatial	Authority	Language
Declare birth	España	41°24'12.2"N 2°10'26.5"E	Municipality of Madrid	EN

**Public administration 3**

### Requesting proof of registration of birth

Geographic level

 Municipality

Country

 Italy

Organisation

Firenze

English

Yes  No

27

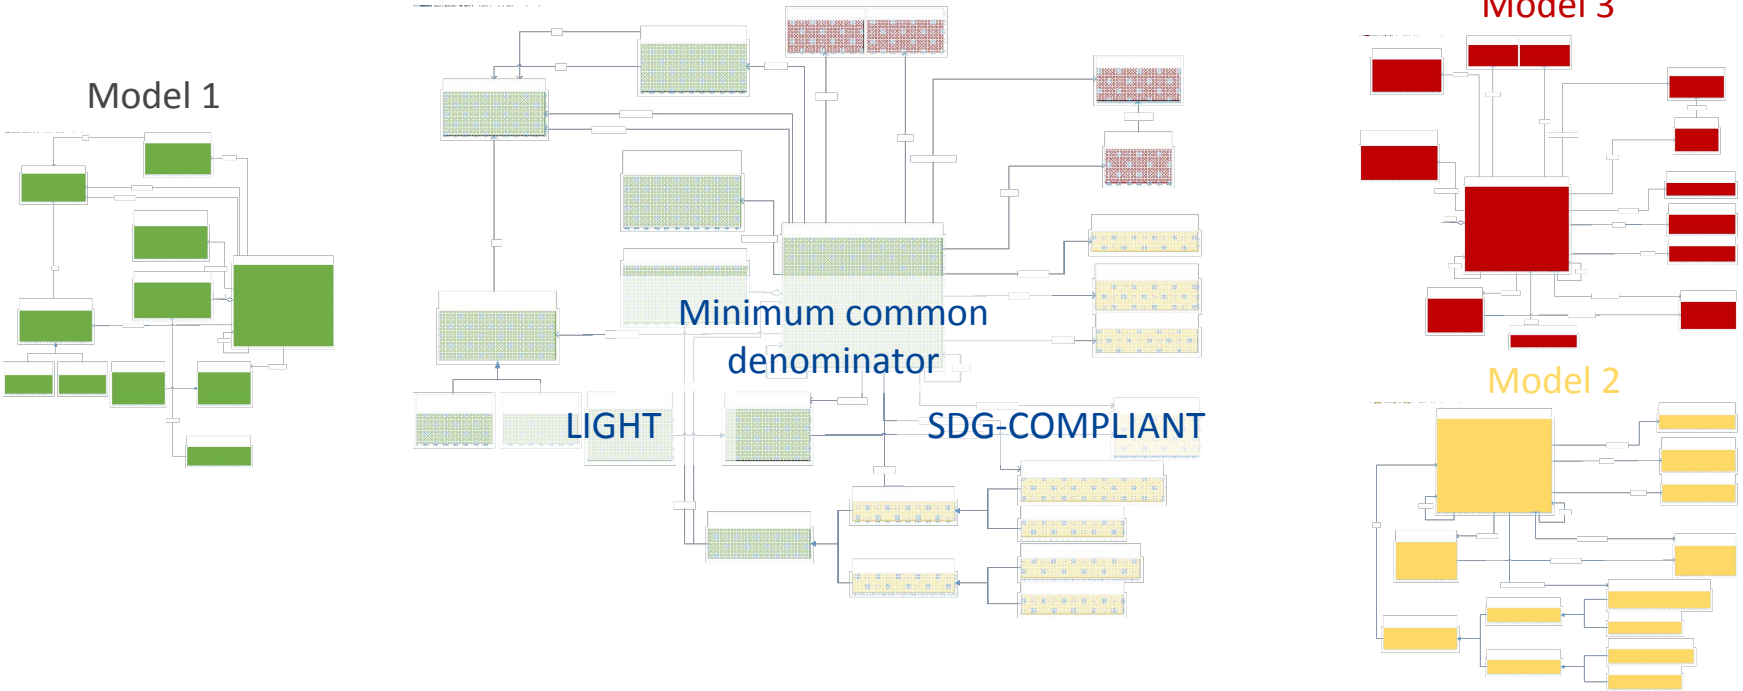

~300

90.000+

When **centralising the information**, we would obtain thousands of different descriptions for similar services, events or public organisations.

Reconciling the descriptions after they are collected, would consume a **lot of time and resources** and would have to be repeated **manually** for any change in the descriptions later on.

For Member States with existing models defined or information following a clear structure, the best balance means to identify the minimum common denominator:

But independently from the needs of the end-users, what are the **options for sharing information** as part of the SDG?

# 2

## SDG Data Model - Part 1

A woman in a blue blazer stands at a whiteboard, drawing a diagram. Three other people are seated around a table in the foreground, looking towards her. The room has large windows and a brick wall.

Practical exercise using the model:  
*Requesting/ Delivering a birth certificate*

# Practical exercise using the model

 [europa.eu/youreurope/citizens/family/couple/getting-public-documents-accepted/index\\_en.htm](https://europa.eu/youreurope/citizens/family/couple/getting-public-documents-accepted/index_en.htm)

 [diplomatie.belgium.be/en/services/services\\_abroad/registry/registration\\_certificates](https://diplomatie.belgium.be/en/services/services_abroad/registry/registration_certificates)

[brussels.be/extract-civil-registry-certificates](https://brussels.be/extract-civil-registry-certificates)

Your Europe

**Public administration**  
**Belgian** Federal Government, internal affairs ministry

**Public administration**  
**Brussels**, civil affairs

How to request a birth certificate?

Marco

Italian citizen, moved to Brussels, has a child in Brussels

# Practical exercise using the model: Your turn (in groups of 3)

## What do you have?

Birth certificate  
**public service description**

Proposed  
**SDG data model**

**Knowledge** about  
your member state's  
national, regional or local level

## How to do the exercise?

You have complete **freedom** to fill the model in.  
Multiple solutions are possible.

If you need more elements,  
you can **draw** them on the model  
(e.g. two types of evidence).

If you need to link classes to each other  
(e.g. to link a specific agent with an action),  
you could use **colored** pens.

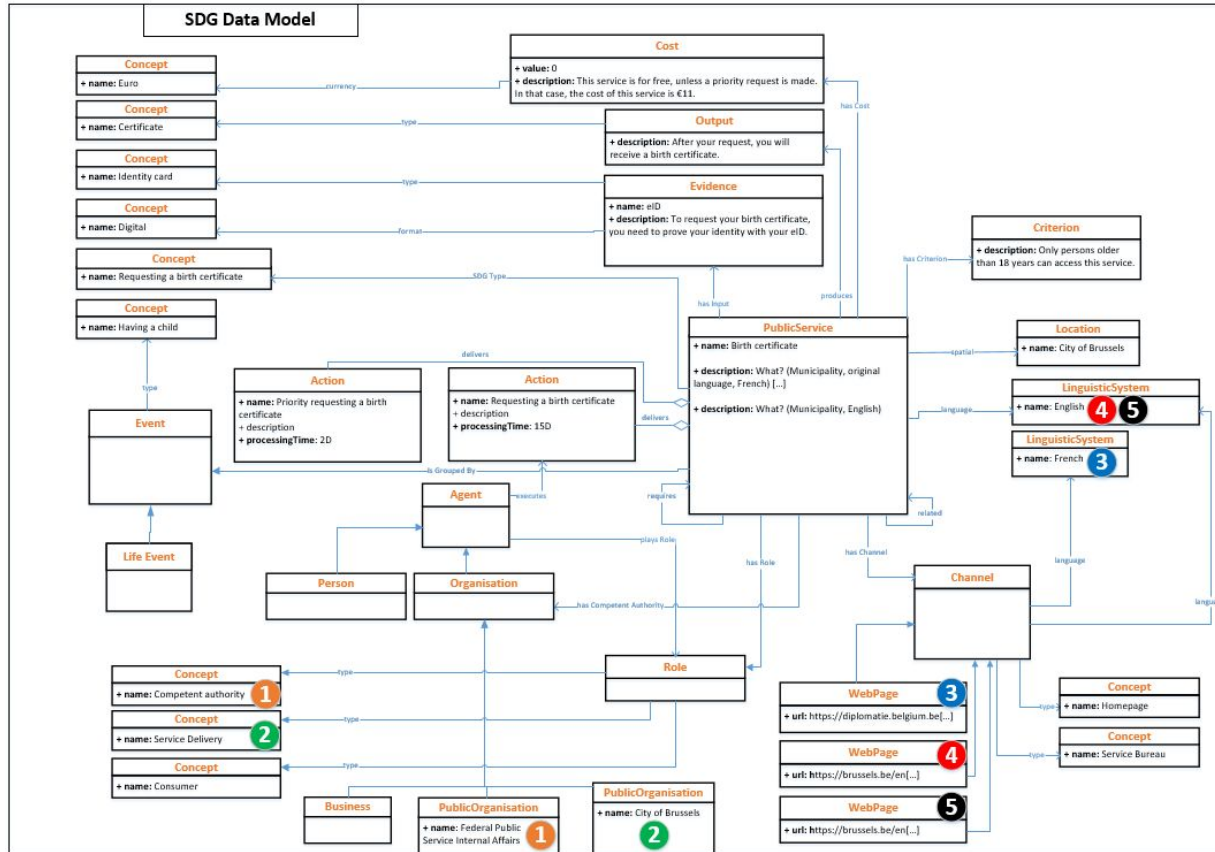

## What is the goal?

Get to **know** the model

Try-out **solutions**

Find out where there could be **issues**

# Practical exercise using the model: Requesting/Providing a birth certificate (proposed resolution)

Visio

# Issue discussion - 1st part

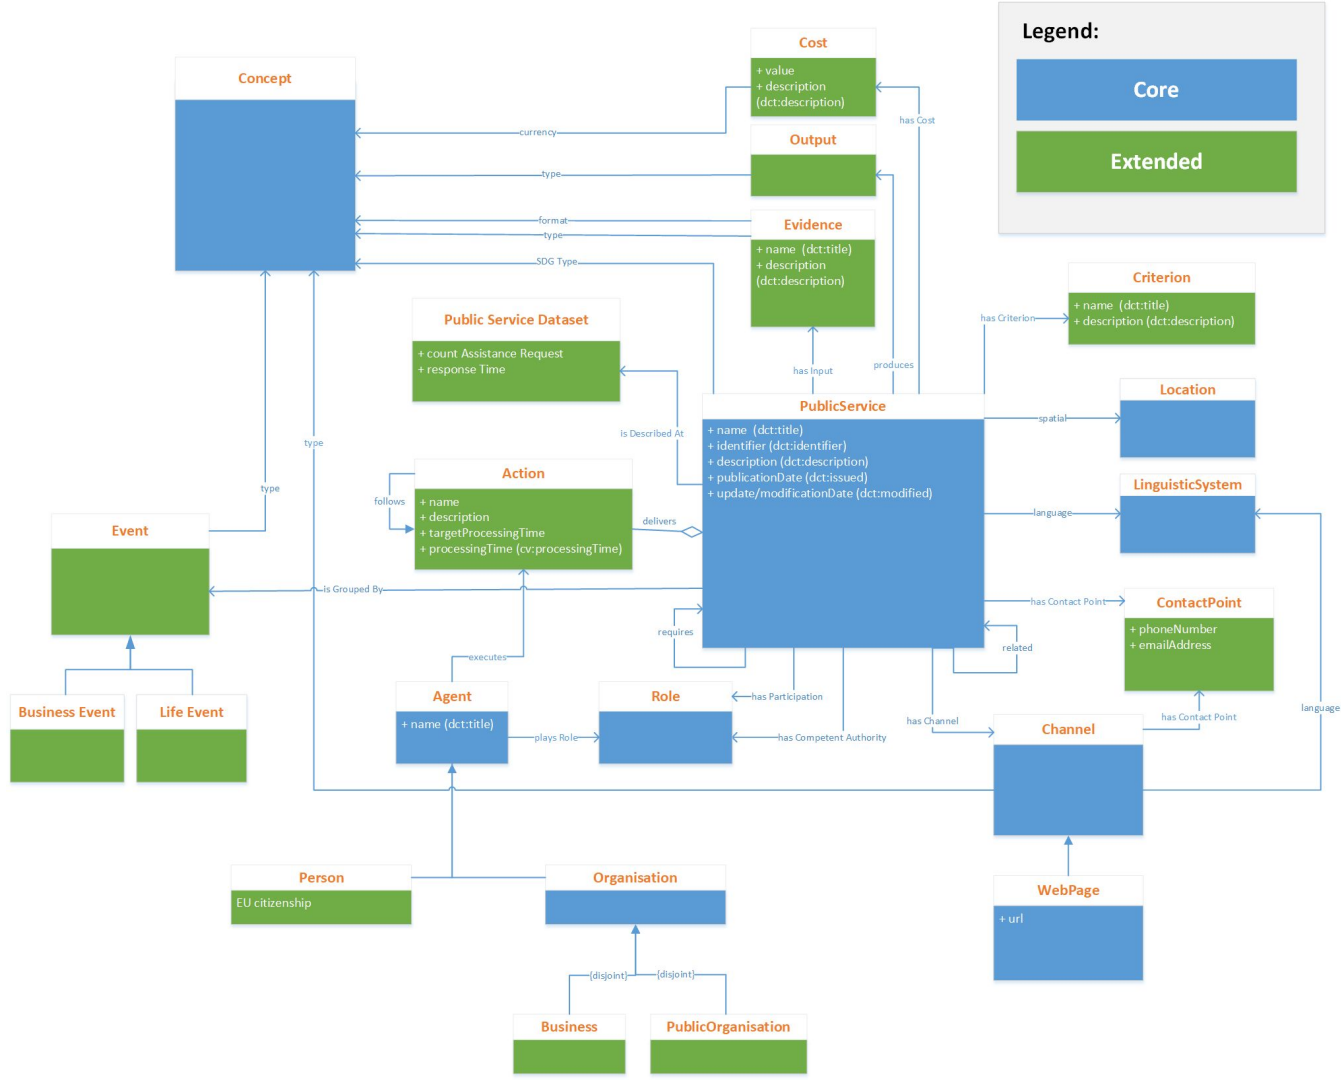

## Focus

SDG Core data model

## Dynamics

- 2 groups starting with different issues for 40 minutes
- Need 1 coordinator per group

# Group 1

1

CPSV-AP, SDG Core, SDG Extended

*How to differentiate the models?*

2

How to model a 'Phase' or a 'Step' in a public service? (SDGR, art. 6 & 10)

*How to model the Action class?*

3

Clarification on the "hasCompetentAuthority" property

*How to model the classes Role and Organisation?*

4

Cost is too restrictive

Should it be part of the Core model? How to tackle it?

# CPSV-AP, SDG Core, SDG Extended

## Description

During the webinar we voted on whether we should make a distinction between **three models**:

- **CPSV-AP (full model** for public service descriptions)
- **SDG Extended** (just the **SDG requirements**)
- **SDG Core** (just the requirements for filling the **SDG link repository**)

As such, I would suggest leaving Business/Life Events and required/related relations out of the SDG Data Models since they are not required by the SDGR.

## Proposed resolution

- Include the **minimum concepts and classifications** that are mentioned or proposed in the regulation for the **core SDG Data Model**, i.e. focusing on the **repository of links** only (information used for describing public service).
- **Concepts and classifications** for **sharing information** required by the SDG besides the repository of links in the **extended model**.
- **Concepts and classifications** for providing the **online procedures** required by SDGR should be part of **OOP model**.
- **Other concepts and classifications** for **enriching** the descriptions but that are not directly required by the SDGR should be part of the **CPSV-AP**.

## Rationale

# CPSV-AP, SDG Core, SDG Extended: missing SDGR concepts

## Description

Not all SDGR concepts are present in the SDG Model. Concepts such as the ones in the table are missing:

## Proposed resolution

- Compared to the first model proposed, the latest proposition is making a clear distinction between the core and extended concepts. The missing concepts listed were not integrated yet in any model but will be subject to a proposition.
- *Where would you see the following concepts being modelled?.*

Examples of missing concepts
Means of redress
Means of appeal
Rules applicable to non-reactivity
Delays
Exceptions (to procedural steps)
Authentication/identification/signatures
Payment methods

# How to model a 'Phase' or a 'Step' in a public service? (SDGR, art. 6 & 10)

## **Description**

The way it is modeled now (loose **actions** that can **'follow'** each other) is **too limited**.

**Procedure steps** (the term used in the SDGR) **are not always sequential**. There may be optional steps that can be skipped, there may be conditional steps based on the situation, etc.

# How to model a 'Phase' or a 'Step' in a public service? (SDGR, art. 6 & 10)

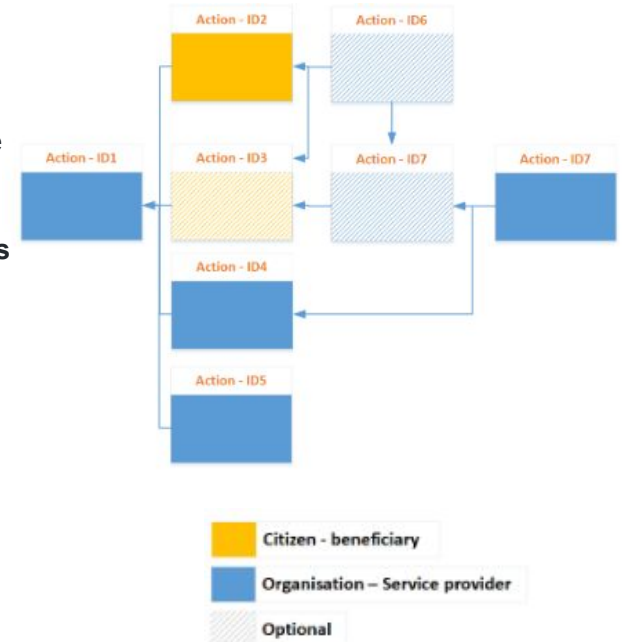

## Proposed resolution

The class Action was foreseen as a generic approach which could fit the different cases pointed out above:

- **Optional vs required:** we could add an optional property to capture this.
- **Unconditional vs conditional:** we could add an optional property to capture this.
- **Executed** by a Person in the role of a citizen, by an Organisation in the role of the Service provider or any other Agent and/or Role combination

With the relation “follows” and its cardinality, we leave it **up to the public administrations** to decide if they would like to detail extensively in separated actions the execution of the service or if a single action is sufficient to describe from a high level the execution of the service. This is the **flexibility** provided by the property *description* with a free text field (in this case, this would include all activities in one description for the so-called above “procedural steps”).

Regarding the sequence, the following visual shows how the relation “follows” could work for different cases together with the optional and conditional properties and the relation executes pointing to an agent:

## Rationale

# Clarification on the "hasCompetentAuthority" property

## Description

Reading the definition of the "Competent Authority" it seems that not only public organizations may be involved. "...professional bodies, and those professional associations or other professional organisations...".

Is there a specific reason to **connect "Competent Authority"** to only **Public Organisation** and not to the broader new class **"Organisation"** that has been introduced?

## Proposed resolution

In general, the main challenge concerns the possibility for an organisation or a person to play different roles in a public service. To overcome this challenge, we would introduce the class Participation (which could be renamed "Role" for better clarity) together with the class org:Organisation to open the delivery of public services to different types of organisations. However, each public service needs to have one single competent authority identified. As a consequence, we would propose to see the term competent authority as an instance relation between the Role class and the Public Service class. In the specification, we will clearly indicate that this relation must exist for one single Organisation (having the role of Competent Authority).

As an alternative, it would also be possible to mention in the specification that the Competent Authority must be a Public Organisation.

## Rationale

# Cost is too restrictive

## **Description**

Reading the definition of the "Competent Authority" it seems that not only public organizations may be involved. "...professional bodies, and those professional associations or other professional organisations...".

Is there a specific reason to **connect "Competent Authority"** to only **Public Organisation** and not to the broader new class **"Organisation"** that has been introduced?

## **Proposed resolution**

We understand that the current proposition is too strict to cover all cases faced by Member States without going into a complex model.

- For the **core model**, we would propose to **remove the Cost class**.
- For the **extended model**, we would propose to relax the constraint by proposing alternatively to have a **description as a free text** where the pricing model could be indicated.
- For the **operational model** (to be further aligned with TOOP, CCCEV etc.) from your examples, we observe a need to relate the cost calculation to specific criteria. For example, if the age is under or above 18 years, the cost is adapted. This is something we will further investigate in collaboration with CCCEV and TOOP.

Please note that this does not cover the information about the online methods of payment, which could also impact the way we model cost in general.

## Rationale

# Group 2

1

CPSV-AP, SDG Core, SDG Extended

*How to differentiate the models?*

2

Service descriptions only or operational data as well?

*What should be part of the SDG information model and the SDG TOOP model?*

3

Values for Evidence

*What should be part of the core model? How to model it?*

4

Multilingual text properties and Language questions

*How to model languages in textual descriptions and as a tag?*

5

Example of the Concept class

*Should it be part of the Core model? How to tackle it?*

# CPSV-AP, SDG Core, SDG Extended

## Description

During the webinar we voted on whether we should make a distinction between **three models**:

- **CPSV-AP (full model)** for public service descriptions)
- **SDG Extended** (just the **SDG requirements**)
- **SDG Core** (just the requirements for filling the **SDG link repository**)

As such, I would suggest leaving Business/Life Events and required/related relations out of the SDG Data Models since they are not required by the SDGR.

## Proposed resolution

- Include the **minimum concepts and classifications** that are mentioned or proposed in the regulation for the **core SDG Data Model**, i.e. focusing on the **repository of links** only (information used for describing public service).
- **Concepts and classifications** for **sharing information** required by the SDG besides the repository of links in the **extended model**.
- **Concepts and classifications** for providing the **online procedures** required by SDGR should be part of **OOP model**.
- **Other concepts and classifications** for **enriching** the descriptions but that are not directly required by the SDGR should be part of the **CPSV-AP**.

## Rationale

# CPSV-AP, SDG Core, SDG Extended: missing SDGR concepts

## Description

Not all SDGR concepts are present in the SDG Model. Concepts such as the ones in the table are missing:

## Proposed resolution

- Compared to the first model proposed, the latest proposition is making a clear distinction between the core and extended concepts. The missing concepts listed were not integrated yet in any model but will be subject to a proposition.
- *Where would you see the following concepts being modelled?.*

Examples of missing concepts
Means of redress
Means of appeal
Rules applicable to non-reactivity
Delays
Exceptions (to procedural steps)
Authentication/identification/signatures
Payment methods

# Service descriptions only or operational data as well?

## Description

The model appears to describe not just public services and their properties, but also operational, instance-level data such as individual applications and individual users (citizen/business with their details such as first name/last name). From how I understand things, the SDG is about describing public services, period.

## Proposed resolution

We would propose to also make a **distinction** between **information about the service** from the **data needed to deliver or receive the service**. While the first is the focus of the core and extended models for the deadlines of 2020 and 2022, the later should be structured according to the semantic architecture proposed by TOOP (or another initiative) for the deadline of 2023.

However, the extended model and the OOP semantic architecture should be aligned.

# Values for Evidence

## Description

Criterion/evidence can be quite broad. For instance, in the example of applying for licensing/protected title, we see only one situation (a master's degree in medicine/a certificate is required). However, such a service is meant for a much broader spectrum of occupations, not just medicine. If we apply this model in the way shown in the example, it would be required to exhaustively list all possible degrees and certificates. I wonder if this is feasible. Wouldn't it be better to stick here to a plain-text description of 'the requirements' for the service as opposed to having CA's list every specific requirement individually?

The list used in the SDG TOOP project seems to have a more practical level

## Proposed resolution

For now in the SDG extended model, we would propose to have the **class "Evidence"** with **two free text properties for the name and description**, a **format property** where we would recommend the use of a controlled vocabulary and finally a **type property** using a controlled vocabulary/classification such as the one you indicated from SDG TOOP. We would also propose the **Criterion class** with **two free text properties for the name and description**. This would give the public administrations the possibility to link evidence and criterion together.

## Rationale

# Multilingual text properties and Language questions

## **Description**

[...] we need to distinguish two layers:

1. text properties that describe the service, action, and any other element in the model. They should be multilingual, therefore with cardinality 0..n so that to allow one to specify more than 1 instance of the text property, one per each language
2. the language related to the content of the public service. A public service can be provided in English, Italian, Dutch. In addition I may want to say that with the web site channel the public service is provided in English and Dutch, and with the phone channel in Italian and Dutch only.

I agree with the last comment to clarify better this aspect of multilingualism

## **Proposed resolution**

We need to differentiate between the language of the content provided by the public administrations from the available languages mentioned for a channel.

- To enable public administrations to provide any pieces of information in multiple languages, we agree with the proposition: each text property from the model could be duplicated using the most appropriate language.
- To give the opportunity to indicate that a certain service or its existing channels are available in certain languages, we propose to keep the current property language (dct:language) with range LinguisticSystem.

## **Rationale**

# Example of the Concept class

## Description

The use of the Concept class is not clear to me. [...] it seems to be used for categorising public services into either information areas, procedures or assistance.

## Proposed resolution

The concept class is meant to be used for classifications or reference data. Such class can then be used by different classes in the SDG model requiring classification (e.g. type of public service) so that there will be different types of classifications (e.g. type of events, etc.).

This needs to be differentiated from the way classifications (or controlled vocabularies) are structured.

...

## Rationale

# Report out

The floor is yours

5' per group

**Enjoy!**

# 3

## SDG Data Model - Part 2

# Group 1

1

## Attributes and Annex II of SDG

*Classification - SDG procedures from Annex II*

2

## Clarification on Processing Time

*How to model processing Time? In which model?*

3

## Variants of procedures

*How to model a service/procedure which can be provided by different administrations at different levels?*

4

## Clarification on "Count Assistance Request" and "Response time"

*How to model statistics such as count assistance request or response time?*

5

## Business and life events as classes and classifiers within CPSV-AP

*Classifications*

6

## Remove related/required relations to Public Service class from SDG Data Model

*Do we need those properties?*

7

## Relationship between the SDG information areas and other classifications

*Classifications*

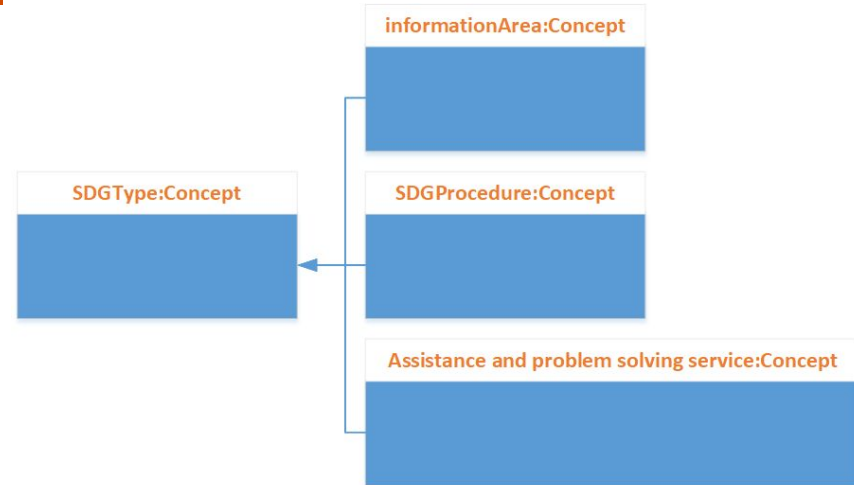

# Attributes and Annex II of SDG

## Description

Is there any attribute regarding the deadline of 12th December 2020 which is used solely for procedures of Annex II? We would like to know if there is such attribute.

## Proposed resolution

The Annex II listing the different SDG procedures is currently modelled as an instance of the class Concept pointing to the list from the Annex II.

Procedures
Requesting proof of registration of birth
Requesting proof of residence
Applying for a tertiary education study financing, such as study grants and loans from a public body or institution
Submitting an initial application for admission to public tertiary education institution
Requesting academic recognition of diplomas, certificates or other proof of studies or courses
Request for determination of applicable legislation in accordance with Title II of Regulation (EC) No 883/2004 ( 1 )
Notifying changes in the personal or professional circumstances of the person receiving social security benefits, relevant for such benefits
Application for a European Health Insurance Card (EHIC)
Submitting an income tax declaration
Registering a change of address

# Clarification on Processing Time

## **Description**

1. We use the same URI for meaning two different things; namely targetProcessingTime and processingTime?
2. the specifications, in section 3.3.4, state "The value of this property is the official time needed for executing a Public Service". This property is in the domain of the new class Action, correct? If so, which is the relationship with the property processingTime defined in CPSV-AP 2.2.1 for the class Public Service itself? The definition seems more oriented to the already foreseen processingTime for Public Service; however, in the model it seems characterizing the brand-new Action class. Could you please clarify better this part?

# Variants of procedures

## **Description**

How to deal with variants of procedures in the catalogue?

In the Czech Republic we have procedures which could be consumed in different situations in different offices.

For example for new ID card citizen could apply at municipality or at the Ministry of the Interior, but at the ministry could be applied only for express issue.

# Clarification on "Count Assistance Request" and "Response time"

## **Description**

It is not very clear the meaning of these two properties and why they are properties of the Public Service Dataset class. Could you clarify? Which competency questions do they target?

### **3.7.1. Count Assistance Request**

This property refers to the number of requests for assistance and problem-solving services.

### **3.7.2. Response time**

This property refers to the average response time for different requests for assistance and problem-solving services.

## **Art. 24**

The competent authorities, the providers of assistance or problem-solving services and the Commission will collect and exchange, in an aggregated way, the number, the origin and the subject matter of requests for assistance and problem-solving services and their response times.

# Business and life events as classes and classifiers within CPSV-AP

## **Description**

[...] leaving Business/Life Events out of the SDG models since they are not required by the SDGR.

## **Proposed resolution**

Keep the business and life events classes and classifications while making sure that the list provided as part of Annex II is integrated within existing lists of life events already used by public administrations.

## **Rationale**

In the Annex II, the services are classified by life events.

Also, users need to find descriptions based on what they know, typically the life events. The same approach can be applied to the business events.

### ANNEX II

#### Procedures referred to in Article 6(1)

Life events	Procedures	Expected output subject to an assessment of the application by the competent authority in accordance with national law, where relevant
Birth	Requesting proof of registration of birth	Proof of registration of birth or birth certificate
Residence	Requesting proof of residence	Confirmation of registration at the current address

# Remove related/required relations to Public Service class from SDG Data Model

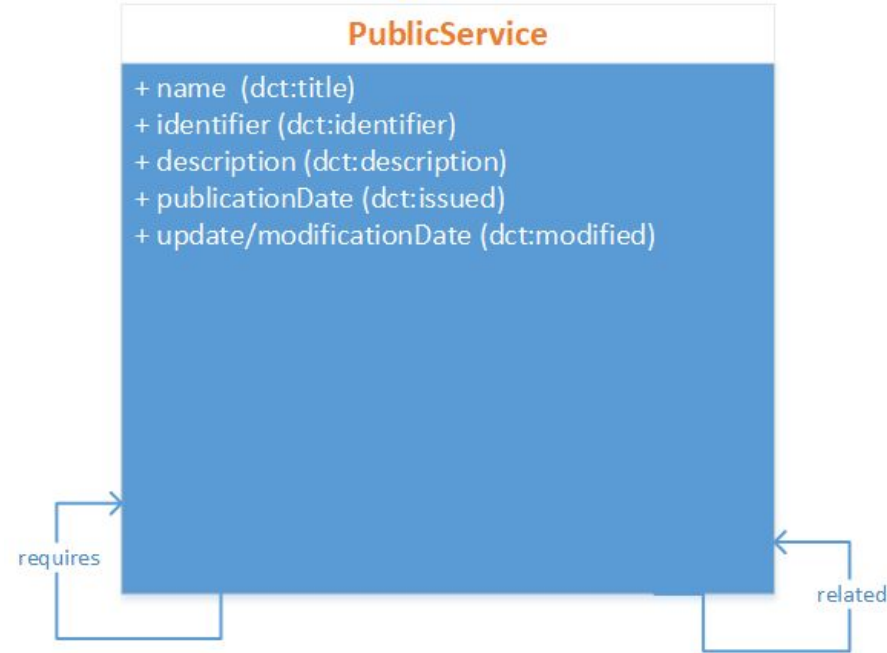

## Description

The properties related and requires are not in scope of the SDG

## Proposed solution

Those properties are not mandatory within the model. However, some public administrations may have sub-services required or related to a service needed by the SDGR. In such a case, they may need to describe those sub-services. While doing so, it would be better if all public administrations use a similar approach and if we can easily retrieve which services are related or required by other services. We therefore propose to keep the two properties.

## Discussion

# Relationship between the SDG information areas and other classifications

## **Description**

What is the relationship between the SDG information areas, thematicArea, LifeEvent Type and BusinessEvent Type (see SDG Classifications v0.02.xlsx)?

## **Proposed resolution**

- SDG information areas (themes, Annex I)
- thematicArea (themes, CPSV-AP)
- LifeEvent Type (CPSV-AP, Annex II)
- BusinessEvent Type (CPSV-AP, implicit Annex II)

# Group 2

1

*Classifications*

# Attributes and Annex II of SDG

## Description

Is there any attribute regarding the deadline of 12th December 2020 which is used solely for procedures of Annex II? We would like to know if there is such attribute.

## Proposed resolution

The Annex II listing the different SDG procedures is currently modelled as an instance of the class Concept pointing to the list from the Annex II.

Procedures
Requesting proof of registration of birth
Requesting proof of residence
Applying for a tertiary education study financing, such as study grants and loans from a public body or institution
Submitting an initial application for admission to public tertiary education institution
Requesting academic recognition of diplomas, certificates or other proof of studies or courses
Request for determination of applicable legislation in accordance with Title II of Regulation (EC) No 883/2004 ( 1 )
Notifying changes in the personal or professional circumstances of the person receiving social security benefits, relevant for such benefits
Application for a European Health Insurance Card (EHIC)
Submitting an income tax declaration
Registering a change of address

# Business and life events as classes and classifiers within CPSV-AP

## **Description**

[...] leaving Business/Life Events out of the SDG models since they are not required by the SDGR.

## **Proposed resolution**

Keep the business and life events classes and classifications while making sure that the list provided as part of Annex II is integrated within existing lists of life events already used by public administrations.

## **Rationale**

In the Annex II, the services are classified by life events.

Also, users need to find descriptions based on what they know, typically the life events. The same approach can be applied to the business events.

### ANNEX II

#### Procedures referred to in Article 6(1)

Life events	Procedures	Expected output subject to an assessment of the application by the competent authority in accordance with national law, where relevant
Birth	Requesting proof of registration of birth	Proof of registration of birth or birth certificate
Residence	Requesting proof of residence	Confirmation of registration at the current address

## Typo in section 3.12.2

### **Description**

The title of the section is "Has contact point" but the text refers to "has input".

In the diagram I did not see any "has input" for the channel class whereas there is "has contact point" property.

And this is not so clear in general. In CSPV-AP 2.2.1 a channel has input, may have accessibility restrictions, and it may be connected with cost since costs for services may vary according to the different types of channels.

# Clarification on Non-Citizen and Citizen

## Description

The distinction of the two classes is only on the citizenship. One is resident in the European Union (lives in one Member State) and has the European citizenship and the other is a person currently resident in the European Union but with no European citizenship. The classes are disjoint.

## Proposed solution(s)

Remove the existing classes and add a property EU citizenship within the class Person.

# controlled vocabularies for authority and spatial

## **Description**

Which controlled vocabularies should be used for location and competent authority?

## **Proposed resolution**

The current solutions given in the later message by @giorgialodi are indeed something that we propose to apply. Namely:

spatial

- Align with DCAT-AP pointing to EU NAL for countries and places. The NAL for continents is perceived as not required as part of the SDGR.
- For locations not in a proposed NAL, the use of geonames URIs would be recommended.

Competent authority

- We propose in #6 to have a class Role for covering the different responsibilities, participations or roles an Agent has in the execution of Action(s). This class would include the Competent Authority.
- This being said, the specific lists of competent authorities will be left to the national/regional/local organisations.

# Relationship between the SDG information areas and other classifications

## **Description**

What is the relationship between the SDG information areas, thematicArea, LifeEvent Type and BusinessEvent Type (see SDG Classifications v0.02.xlsx)?

## **Proposed resolution**

- SDG information areas (themes, Annex I)
- thematicArea (themes, CPSV-AP)
- LifeEvent Type (CPSV-AP, Annex II)
- BusinessEvent Type (CPSV-AP, implicit Annex II)

# Deviation between Your Europe-categories and SDG Data Model-categories

## **Description**

Will the categories and sub-categories which are used on Your Europe be changed according to the information areas and life/business events used in the SDG Model?

E. g. the category "Human Resources" with sub-category "Employment contracts", "Working hours, holiday and leave" is categorized differently on Your Europe than in the excel-sheet with the proposed classifications (uploaded document "SDG Classifications v0.02")

# CPSV-AP tools: use cases

## Use case 1

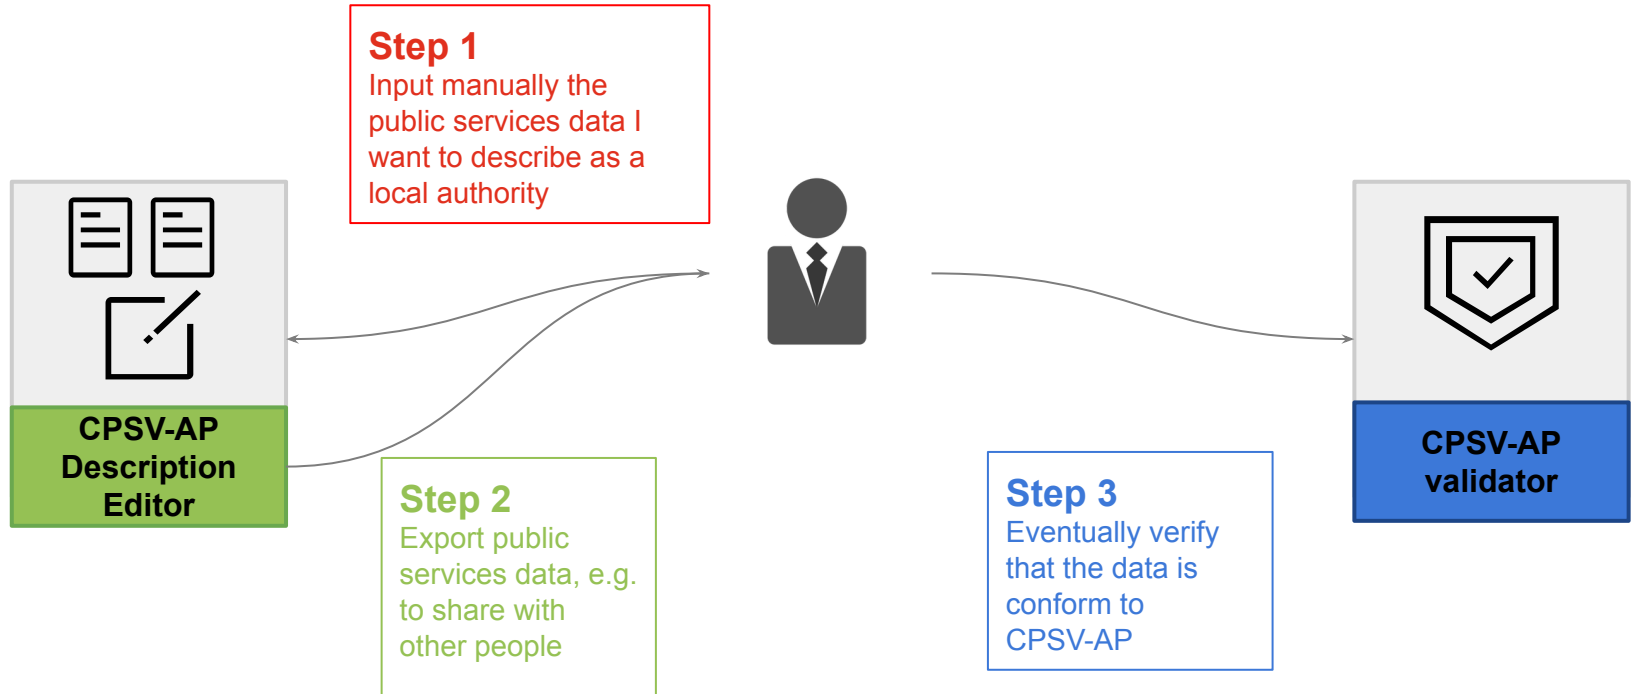

*'I am a local authority, describing public services manually in an editor tool.'*

## Use case 2

*'I am a national authority, collecting public services data from several local regions / municipalities.'*

# Use case 1

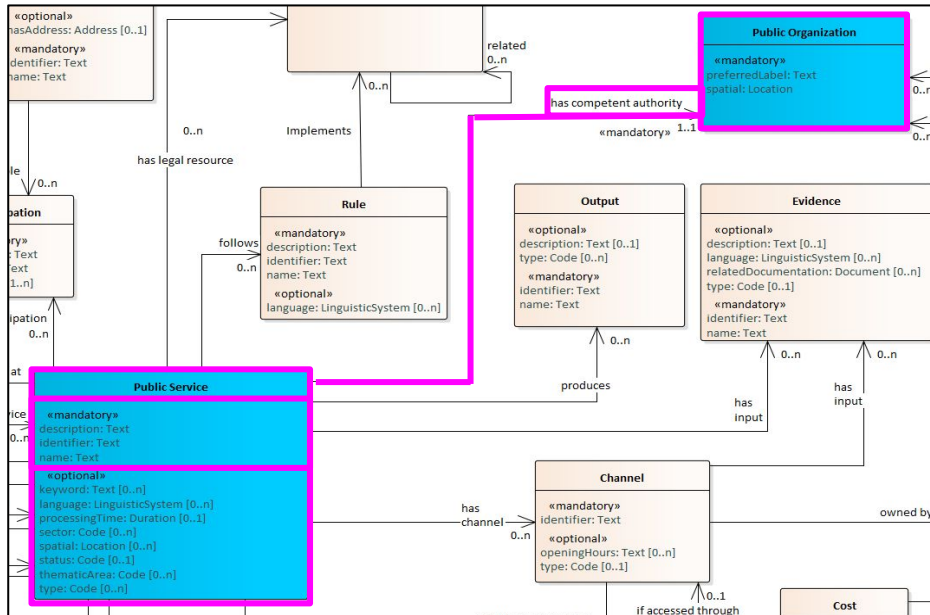

*'I am a local authority, describing public services manually in an editor tool.'*

# Demo objective use case 1: describe public services

Example: Public service **Start-up grant** in public organisation **Enterprise Estonia**.

CPSV-AP 2.2.1 data model

EE (Enterprise Estonia)

CPSV-AP Description Editor

The screenshot shows the CPSV-AP Description Editor interface. The main content area displays the following information for the 'Start-up grant' service:

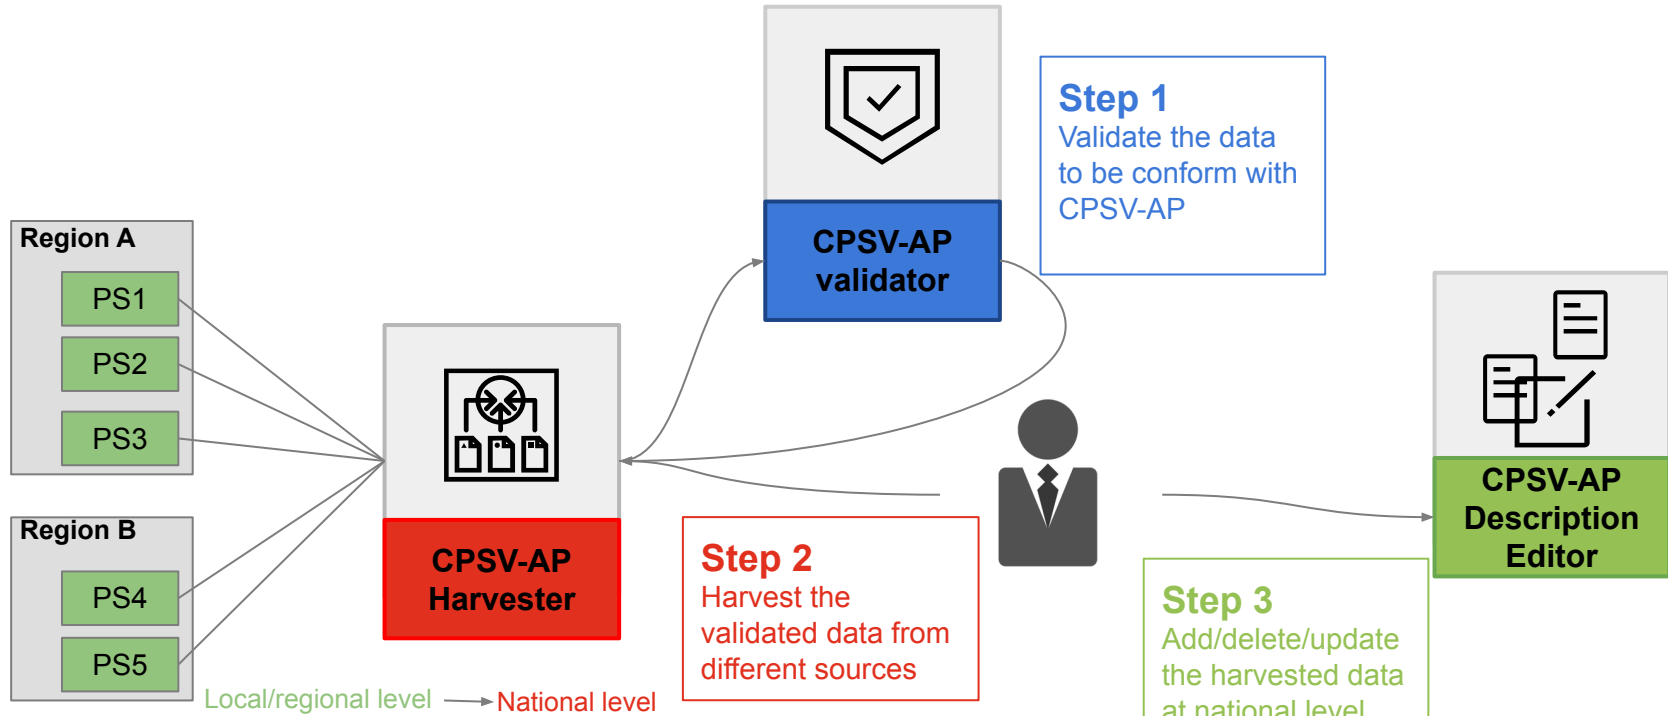

- Name:** Start-up grant
- Description:** The start-up grant aims to support the creation of enterprises that have a lot of development potential, and thereby expand regional entrepreneurship and number of exporters.
- Has competent authority:** EE (Estonian Enterprise)

The interface also includes a navigation menu (Home, Add content, Browse all content, Browse public services, Log In, Export), a language selector (English), and a user menu (My account, Log out). The 'Start-up grant' entry is highlighted with a pink box.

Start-up grant

# Use case 2

*'I am a national authority, collecting public services data from several local regions / municipalities.'*

# Demo objective use case 2

## Step 1

Validate the Finnish data against CPSV-AP 2.2.1

cpsv-ap.semic.eu says

The following files have been processed:

\* [http://35.181.155.22:8890/Finnish\\_data/FinnishServices\\_3.ttl](http://35.181.155.22:8890/Finnish_data/FinnishServices_3.ttl) is not conform to CPSV-AP and it is not harvested

\* [http://35.181.155.22:8890/Finnish\\_data/FinnishServices\\_2.ttl](http://35.181.155.22:8890/Finnish_data/FinnishServices_2.ttl) is conform to CPSV-AP and it is harvested

Number of triples added: 293

OK

## Step 2

Harvest the Finnish data

**CORE PUBLIC SERVICE VOCABULARY CPSV-AP Harvester**

This service harvests one or more public service description files structured according to the [CPSV-AP](#) specification.

Visualise all data Harvest Clean data Schedule harvesting

**Parallel sessions**

## **Parallel session 1:**

**Tools for building a catalogue of services and how they would work in a SDGR context**

# Overview of the tools

## Approaches for the tools

1. Customization from a **data model** perspective  
*Description Editor: creating new classes for the SDG*
2. Customization from an **integration** perspective  
*How the tools can be integrated into the SDG and your tools*

# 1. Customization from a data model perspective

The tools could be reused for the SDG data model. Example with the Description Editor:

## Reusing CPSV-AP + new classes

### Description Editor demo:

Action -> delivers -> Public Service

Add a new class, properties and a relation

Class: **Action**

Mandatory properties: **name**, **description**

Optional properties: targetProcessingTime, processingTime

Optional relation: **delivers**

(bold: content we will add in the demo in next slide)

## Previous SDG data model

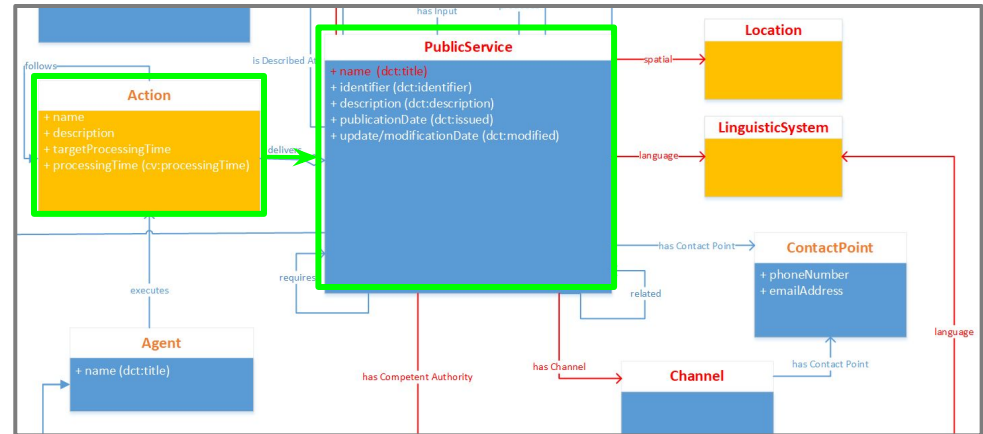

### Legend:

New class

CPSV-AP class

+ CPSV-AP property

+ minimum elements for starting

# 1. Demo

## Step 1:

Add content type “Action” →

Content types				
<a href="#">+ Add content type</a>				
Name	Operations			
Action (Machine name: action)	edit	manage fields	manage display	delete
Address (Machine name: address)	edit	manage fields	manage display	delete
Agent (Machine name: agent)	edit	manage fields	manage display	delete
Article (Machine name: article) Use articles for time-sensitive content like news, press releases or blog posts.	edit	manage fields	manage display	delete
Basic page (Machine name: page) Use basic pages for your static content, such as an 'About us' page.	edit	manage fields	manage display	delete
Business Event (Machine name: event)	edit	manage fields	manage display	delete

## Step 2:

Add the mandatory properties

- name
- description

Add the optional relation to Public

Service

- delivers

Action				
Label	Machine name	Field type	Widget	Operations
+ Title	title	Node module element		
+ URL path settings	path	Path module form elements		
+ URL redirects	redirect	Redirect module form elements		
+ Body	body	Long text and summary	Text area with a summary	edit delete
+ name	field_name_action	Text	Text field	edit delete
+ description	field_description_action	Text	Text field	edit delete
+ delivers	field_delivers_action	Node reference	Select list	edit delete

+ Add new field

- Select a field type -  - Select a widget -

## Step 3:

Set the RDF mappings

e.g. name:

- RDF:Predicates: dct:identifier
- Attribute Type: property
- Datatype: rdfs:Literal

Action	
Manage the way this bundle and its fields are represented in RDF. The mappings defined here will be used to publish RDFa in the site's HTML pages.	
Type cpdv.Action	
Title dct:identifier property rdfs:Literal	<b>RDF Predicates</b> dct:identifier <input type="text"/>
Body content:encoded property	<b>Attribute Type</b> property <input type="text"/>
description dct:description property rdfs:Literal	<small>For fields containing literals—things such as plain text, HTML, numbers—use the property attribute. For fields containing references to other things—uris and node references, for example—use the rel or rev attribute.</small>
name dct:title property rdfs:Literal	<b>Datatype</b> rdfs:Literal <input type="text"/>
	<small>Enter the datatype for rdfs using CURIE syntax. For a list of common datatypes, see XML Schema datatypes.</small>

## 2. Customization from an integration perspective

### CPSV-AP Tools: API usage

#### CPSV-AP Harvester

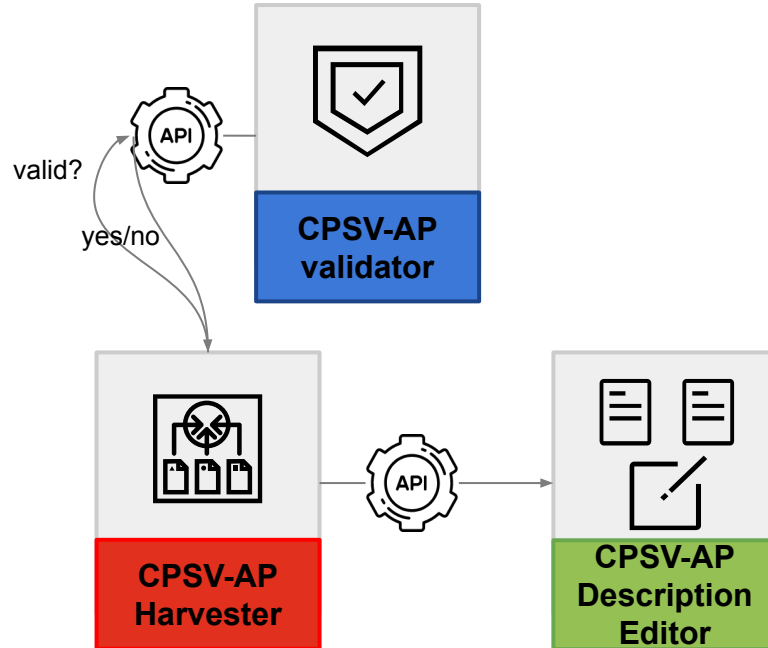

The harvester harvests data from different sources. It sends the URLs to the CPSV-AP validator by contacting through its API.

#### CPSV-AP validator

The validator checks the correctness of the data and provides back the conformance results to the Harvester. The API is based on REST API and the documentation can be accessed online.

#### CPSV-AP Description Editor

The Description Editor connects to the Harvester through the custom build API.

# 2. Demo

## Step 1

The screenshot shows the CPSV-AP Harvester interface. At the top, it says "This service harvests one or more public service description files structured according to the CPSV-AP specification." Below this is a table with columns for "Type", "Identifier", and "Additional info". The table lists several public services related to waste management, such as "Waste management", "Notification of primary production", "Document and information service", "Extraction of land resources", "Fire inspections", "Environmental notification", "Fire-school education", and "Environmental permit".

Type	Identifier	Additional info
PublicService	http://data.europa.eu/Finland/PS/WasteManagement	Name: Waste management
PublicService	http://data.europa.eu/Finland/PS/NotificationOfPrimaryProduction	Name: Notification of primary production
PublicService	http://data.europa.eu/Finland/PS/DocumentAndInformationService	Name: Document and information service
PublicService	http://data.europa.eu/Finland/PS/ExtractionOfLandResources	Name: Extraction of land resources
PublicService	http://data.europa.eu/Finland/PS/FireInspections	Name: Fire inspections
PublicService	http://data.europa.eu/Finland/PS/EnvironmentalNotification	Name: Environmental notification
PublicService	http://data.europa.eu/Finland/PS/FireSchoolEducation	Name: Fire-school education
PublicService	http://data.europa.eu/Finland/PS/EnvironmentalPermit	Name: Environmental permit

## Step 2

The screenshot shows the API interface for the CPSV-AP Harvester. It displays the URL "http://data.europa.eu/Finland/PS/WasteManagement" and provides a "JSON" view of the data. The JSON output is a detailed description of the waste management service, including its name, identifier, and a detailed description of the service's purpose and responsibilities.

## Step 3

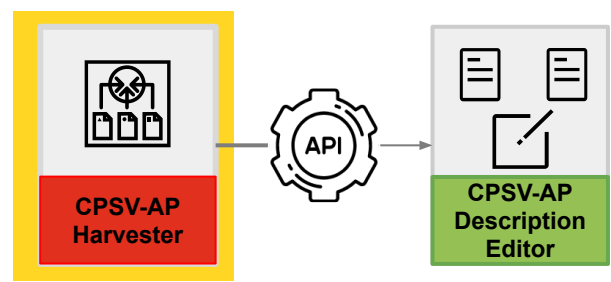

The screenshot shows the CPSV-AP Description Editor interface. It features a blue header with the "CORE PUBLIC SERVICE VOCABULARY" logo and navigation links. The main content area displays the "WasteManagement" service description, including its name, description, and a detailed description of the service's purpose and responsibilities. A "User menu" is visible in the top right corner.

## 2. Demo - step 1: CPSV-AP Harvester

Public service: Waste management of Finland

**CORE PUBLIC SERVICE VOCABULARY** **CPSV-AP Harvester**

This service harvests one or more public service description files structured according to the [CPSV-AP](#) specification.

GROW

# Annex

*In annex you can find a short explanation on how a data model is created.*

How is a data model built?

Starting from the regulation and having in mind typical structures of information such as the previous tables, we identify the important **information or classes:**  
**Service**

Title	Country	Geographic level	Event	Owner	Language
Providing proof of registration of birth	Spain	Local	Having a child	Municipality of Madrid	English, Spanish
Providing proof of residence	The Netherlands	Local	Moving to/from the country	Municipality of Utrecht	Dutch, English

Starting from the regulation and having in mind typical structures of information such as the previous tables, we identify the important **information** or classes:  
**Event**

### Public organisation

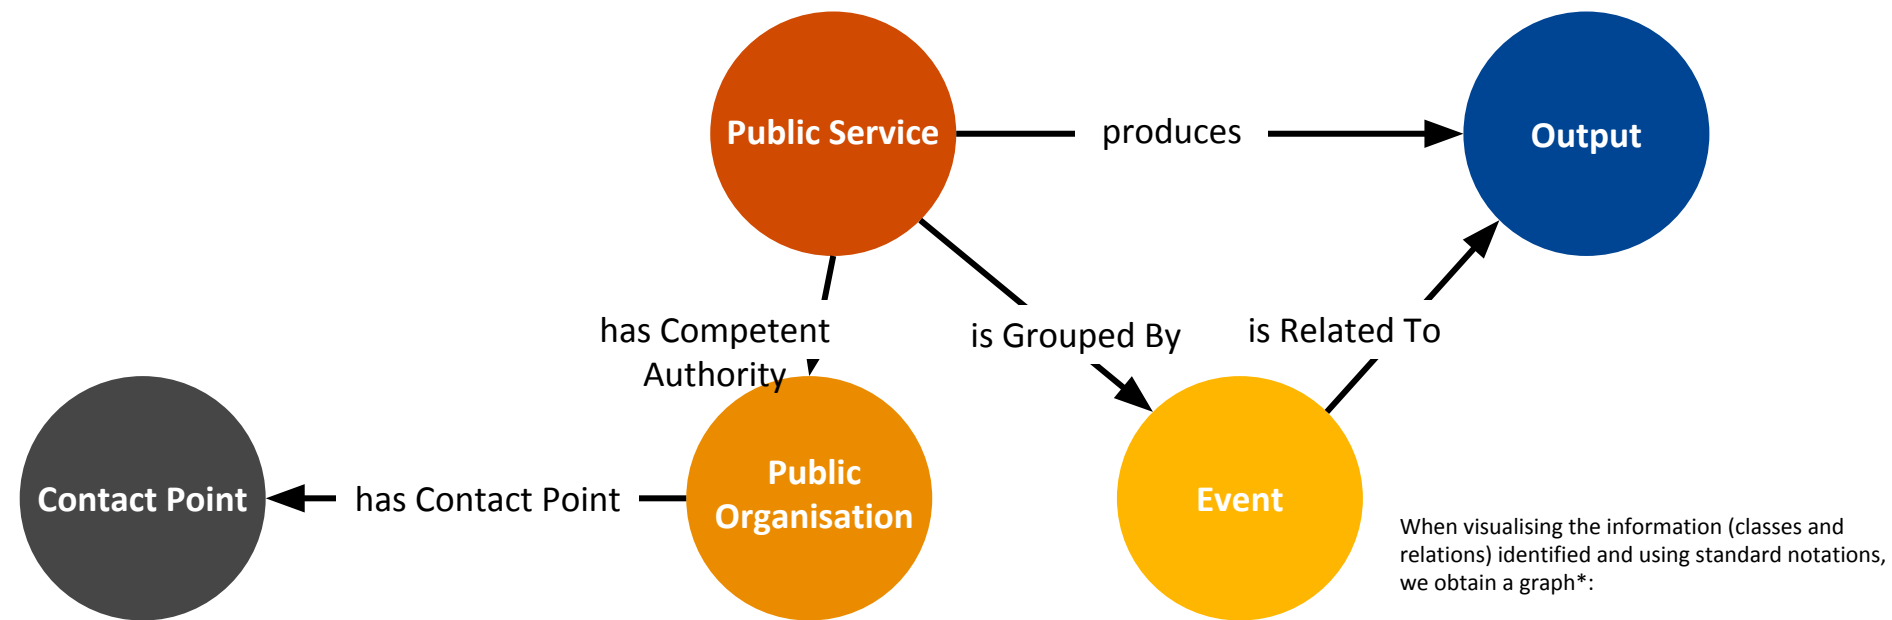

Name	Description	Output
Having a child	This life event groups public services related to becoming a caretaker for a child, for instance in case of giving birth, adopting, receiving a foster child...	Proof of registration of birth or birth certificate
Moving to/from the country	This life event groups public services that relate to when someone moves from one country to another.	Confirmation of registration at the current address
Starting education	This life event groups any public service related to education, for example pre-school education, elementary school, higher education and university...	Decision on the application for financing or acknowledgement of receipt
Looking for a new job	This life event groups public services for when someone looks for a new job or starts a new job.	
Driving a vehicle	This life event groups public services related to driving a vehicle, for instance car, motorcycle... Some example public services are getting your driver license, following driving lessons, registering your car...	

Official name	Preferred label	Geographic coverage	Contact
Municipality of Utrecht	Expat Center Utrecht	Local	Expat Center Utrecht, Stadsplateau 1, 3521 AZ Utrecht Tel. 030 286 00 00
Municipality of Madrid	Registro Civil	Local	Registro Civil, Calle de Pradillo, 66, 28002 Madrid, Spain Phone. +34 914 93 66 30

From the classes identified, we continue identifying the information used to detail further the classes and the relations between those classes:

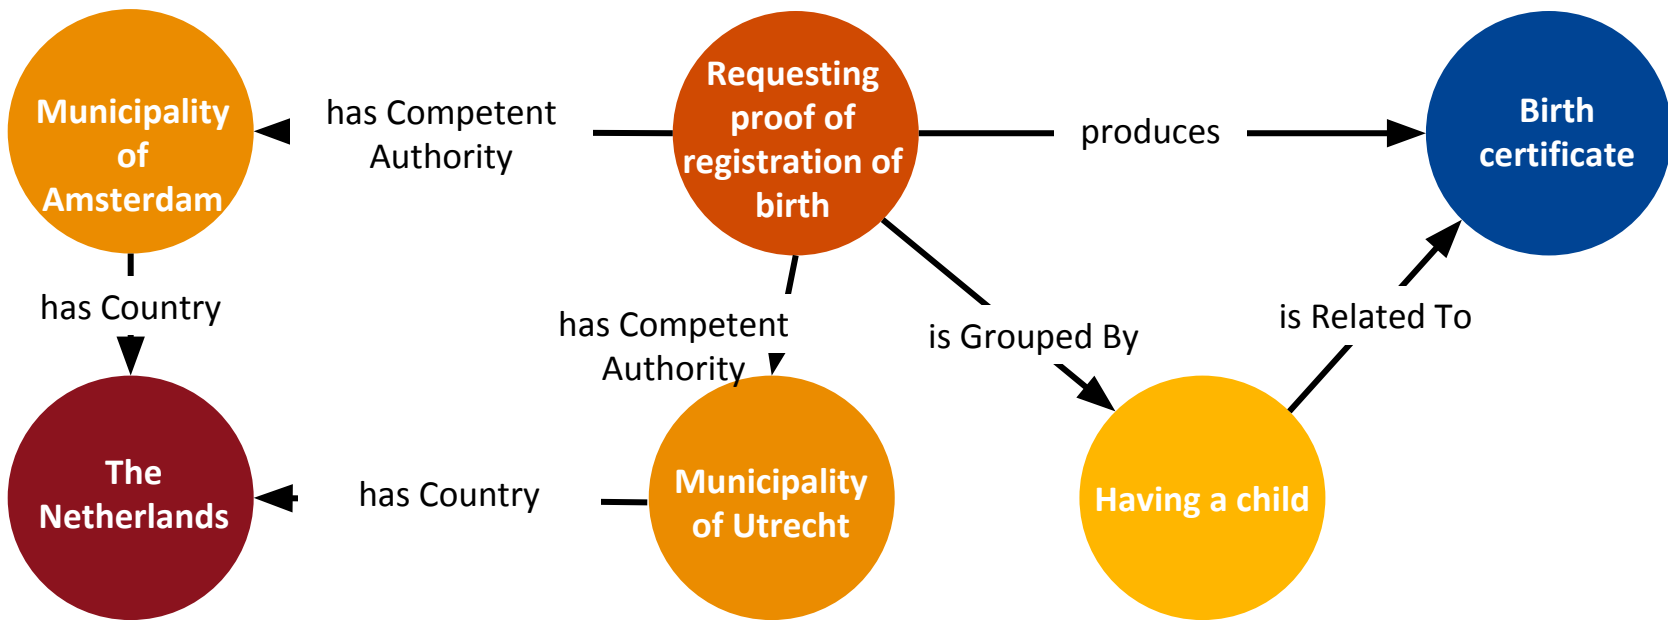

- Services have public organisations responsible for it
- Services produce outputs
- Services can be grouped by events
- Public organisations have contact point(s)
- Events are related to outputs
- ...

When visualising the information (classes and relations) identified and using standard notations, we obtain a graph\*:

A graph acquires knowledge once public administrations start using it with actual descriptions (data):

The power of a graph is that you can easily retrieve information based on simple queries.

And the more you add information, the more you create new connections you had not perceived before, enriching the search and quality of results the end-users obtain.

This is not only useful for the end-users.

A graph is a Web-based technology. It means that, once securely connected, your information can flow from one administration to another at the frequency of your choice.

And the owner of the descriptions will have only one place where the information needs to be maintained, at the level of his or her choice.
